

What is claimed is:

1. An electrically conductive thermoplastic resin composition to which an electrically conductive agent is added, characterized in that a base resin contains a polyester resin.
2. The electrically conductive resin composition according to claim 1, wherein the electrically conductive resin composition has the water absorption factor of less than 1.0 % which is measured in conformity with ASTM D-570 when the composition is left standing for 24 hours in an environment of the temperature of 50°C and the relative humidity of 90 %.
3. The electrically conductive resin composition according to claim 1 or 2, wherein the polyester resin is polybutylene terephthalate, polyethylene terephthalate, or polyethylene naphthalate.
4. The electrically conductive resin composition according to any one of claims 1 to 3, wherein the electrically conductive resin composition further contains a filler.
5. The electrically conductive resin composition according to claim 4, wherein the amount of the filler admixed is 10 to 50 parts by weight with respect to 100 parts by weight of the resin.
6. The electrically conductive resin composition according to claim 4 or 5, wherein the filler is fibrous calcium silicate.
7. A resinous base-body for a photosensitive drum used in electrostatic recording processes, wherein the resinous base-body is made of the electrically conductive resin composition according to any one of claims 1 to 6.
8. A photoconductive drum comprising a photoconductive layer on the resinous

base-body for the photosensitive drum according to claim 7.
